Synthesis and characterisation of poly(ether imine)s **1** – **4** including thermal, spectroscopic, GPC and elemental analyses. Gel permeation chromatograms for poly(ether imine)s **1** – **4**. Further analysis of sequence-effects in the ¹³C NMR spectra of poly(ether imine)s. ¹H NMR spectrum of polymer **2**.

Synthesis of poly(ether imine)s: A sample of PEEK powder (0.577 g, 2.00 mmol) was placed in a reaction tube equipped with a nitrogen inlet and mechanical stirrer, together with diphenyl sulfone (9.0 g, 41 mmol) and 2,2-diphenylethylamine (1.972 g, 10 mmol). The system was stirred under a gentle, continuous purge of dry nitrogen and heated slowly ($90\text{ }^{\circ}\text{C h}^{-1}$) to $315\text{ }^{\circ}\text{C}$ to dissolve the polymer. The temperature was then lowered to $270\text{ }^{\circ}\text{C}$ and the solution was stirred at this temperature for 3 h, giving a clear, viscous, bright yellow solution. The reaction mixture was then poured onto an aluminium tray to cool. The resulting beige solid was dissolved in dichloromethane (100 mL) and the polymer recovered as a pale yellow powder by precipitation in methanol (300 mL). Traces of diphenyl sulfone were removed by extracting the polymer in refluxing methanol for 1 h, and the product poly(ether imine), **1**, was then filtered off and dried at $80\text{ }^{\circ}\text{C}$ (0.83 g, 89% yield). Analogous poly(ether imine)s **2**, **3** and **4** were obtained under the same conditions by reactions, respectively, of PEEK with 3,3-diphenylpropylamine, PEK with 2,2-diphenylethylamine, and PEK with 3,3-diphenylpropylamine.
